Who governs, who operates, who responds

A role is a set of responsibilities and access rules. It is not always a person's rank or direct manager.

1 · GOVERNANCE SETS THE BOUNDARIES

Super Admin

Platform and tenant setup; access and feature controls.

Web · platform scope

→

System Admin / Admin

Organisation users, roles, resources and configuration.

Web · organisation scope

Two boundaries: tenant = organisation; silo = department. Pages, actions and database policies must agree for a boundary to hold.

↓ Sets up the people, equipment and access used by the operational desks below.

2 · OPERATIONS ARE PARALLEL DESKS, NOT ANOTHER ADMIN LADDER

System Controller

Cross-department command view: coverage, incidents, surveillance and operational systems.

Web · command / monitor

Department lead

Supervisor; Police Captain; FireChief / Chief. Plans duty and oversees the team.

Web + optional field app

Call and dispatch desks

Logger records calls; Dispatcher assigns units. ControlRoom / Operator can do both.

Web · work handoff, not rank

3 · FOUR FIELD DEPARTMENTS RECEIVE THE WORK

Metro Police

Captain leads; Police / Officer / Metro and Security respond.

Field app important

Metro Fire

FireChief / Chief lead; Firefighter responds.

Field app important

Medical

Doctor and Paramedic are field roles. A distinct team-lead role is not defined.

Field app important

Disaster

Disaster responder is defined. A distinct team-lead role is not defined.

Field app important

Logger: may log a call; cannot use the dispatch queue or assign units.

Dispatcher: may work the queue; cannot use the call-intake route.

System Controller: operates modules; tenant, feature and access controls are excluded.

Field staff: receive assigned work; account and platform administration are separate.

How work reaches a device and returns

Solid arrows show a handoff or data update.
The same person may cover more than one desk.

A · INCIDENT WORKFLOW

Caller
Reports an emergency, location and contact details.

Outside the platform

→

Call intake
IncidentLogger captures the report. ControlRoom / Operator can also do this.

Creates incident record

→

Pending queue
The new incident waits for routing and a unit assignment.

Shared operational record

→

Dispatch desk
Dispatcher routes the call and assigns a unit. ControlRoom / Operator can also do this.

Updates incident + alerts crew

→

Field crew · mobile
Police, Fire, Medical or Disaster crew receives the job and updates its status.

Acknowledges / en route / on scene

Separate desks: Logger cannot dispatch; Dispatcher cannot log intake.

Combined desk: ControlRoom or Operator can cover both jobs.

B · DUTY AND SHIFT WORKFLOW

Department lead · web
Creates duty posts, assigns people for a date and publishes the board.

→

Shared records
Published roster, post, incident and status data connect web and mobile.

→

Field worker · app
Reads schedule; acknowledges duty; completes shift checks; receives and updates incidents.

App acknowledgements, on-duty status and incident updates return to supervisor / dispatch views

Case Manager
Reviews the incident record and closes cases after the operational response.

Viewer
Observes dashboards, incidents and reports. Intended as a read-oriented seat.

Mobile priority
Core for field responders; useful for Captain / Fire leadership when they also respond. Admin, intake, dispatch and controller work is mainly web.

Code reality: These arrows explain the intended workflow, not a guarantee that every data permission is complete. Route rules split intake from dispatch and server actions check some writes; tenant and silo isolation also depend on deployed database policies. Viewer write restrictions and cross-tenant behavior require a separate security audit. Mobile schedule refreshes on open / pull; a new duty publication is not confirmed as a device push alert.
